

ABSTRACT

A device and method is provided to enable improved control of streaming live delivery and recording processing as to a client from a server of tuner-received content. This is configured such that a tuner control instance which executes streaming delivery of the tuner-received content under the control of the tuner, and a storage unit control instance which executes recording of the tuner-received content under the control of the content storage unit such as a hard disk, are independently set, and to each a channel list URL and video capsule URL are set as the content URL capable of specifying the processing control object, and requests can be received from the client individually by setting a control instance ID which is a control instance (AVT instance) identifier. By this configuration, independent processing according to the client request is enabled.
